TIBCO Streaming Connectivity

An important component of the TIBCO Streaming platform is the broad set of pre-built connectivity options that integrate with a variety of real-time data feeds, messaging systems, high-capacity data stores, alternative programming languages, and real-time interactive dashboards. With over 100 pre-built options available, TIBCO Streaming software enables you to more rapidly design, test, deploy, and modify real-time applications. In addition to the connectors below, TIBCO Streaming software is extensible, which means that we give power to developers to create their own custom connectors via APIs and samples.
